Futility analyses - a strategic tool in drug development and not futile at all!

Kaspar Rufibach Methods, Collaboration & Outreach Group Roche Basel Effective Statistician Academy, 15th February 2024

Dr. Alexander Schacht • 1st

Fear is a reaction. Courage is a decision. Medical affairs/RWE/HTA expert ... 5d • 🔞

500 registrations already and still many more register for The Effective Statistician conference happening next week.

It is still time for you to register!

One of the reasons for the many registrations is the line-up of speakers.

One of them is Kaspar Rufibach.

Kaspar is not only an outstanding statistician who has a significant influence as a methods statistician at Roche and beyond his company. He is also an excellent speaker.

His presentations are always interesting, relevant, and entertaining.

Having worked closely with many statistical teams, his experience and advice has great relevance for any statistician in clinical research.

I am thrilled that he will speak at my conference again this year.

And his contributions always stimulate a very good discussion.

Having worked closely with many statistical teams, his experience and advice has great relevance for any statistician in clinical research.

I am thrilled that he will speak at my conference again this year.

And his contributions always stimulate a very good discussion.

I am a statistician after all!

Kaspar Rufibach Futility analyses #3 / 39

Reduce expected sample size if drug does not work.

Risk to stop working molecule typically small.

Not only about "your" trial, but about patients, risk mitigation, other projects!

No threat to integrity or regulatory acceptance.

If done properly!

Kaspar Rufibach Futility analyses #4 / 39

What are futility interim analyses?

Kaspar Rufibach Futility analyses #5 / 39

Option to stop trial early.

Protect patients.

Even if continued to final analysis trial unlikely to be significant.

Kaspar Rufibach Futility analyses #6 / 39

How much do we gain with futility interim analyses in clinical trials?

Kaspar Rufibach Futility analyses #7 / 39

Design:

- 2-sided significance level: $\alpha = 0.05$.
- Power: $\alpha = 80\%$.
- Hazard ratio to detect: 0.75.

Timing:

- n = 1200.
- Medians in months: 72 and 96.
- Accrual: ramp-up first six months, then 42/month.

Single-stage design (no interim):

- 380 events needed in any case.
- Time to cutoff (months): 60 under H₀.

Kaspar Rufibach Futility analyses #8 / 39

Add futility interim analysis:

After 30% (= 114) of events.

Stop trial if hazard ratio > 1.

Kaspar Rufibach Futility analyses #9 / 39

We do not compensate for power loss. All computations under H_0 .

$$P(\text{stop at interim}) = 0.5.$$

$$0.5 \cdot 114 + 0.5 \cdot 380 = 247.$$

On average 380 - 247 = 133 or 35% less events.

Expected time to cutoff: 44 vs. 60 months.

Kaspar Rufibach Futility analyses #10 / 39

Power loss

Kaspar Rufibach Futility analyses #12 / 39

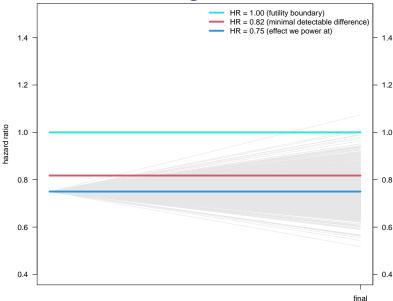

1000 simulated trials assuming HR = 0.75, no interim

Kaspar Rufibach Futility analyses #13 / 39

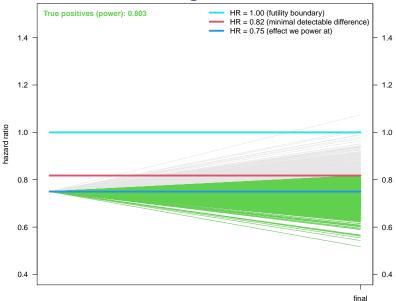

final

1000 simulated trials assuming HR = 0.75, no interim

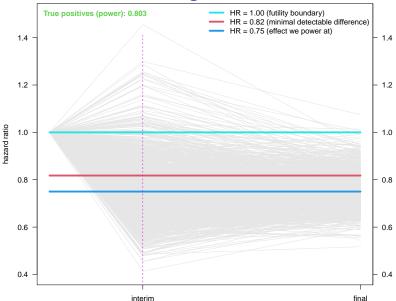

Kaspar Rufibach Futility analyses #14 / 39

1000 simulated trials assuming HR = 0.75, no interim

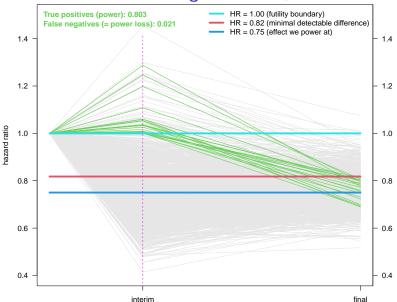

Kaspar Rufibach Futility analyses #15 / 39

1000 simulated trials assuming HR = 0.75, with interim

Kaspar Rufibach Futility analyses #16 / 39

1000 simulated trials assuming HR = 0.75, with interim

Kaspar Rufibach Futility analyses #17 / 39

Fixed design: 380.

Futility added, maintain power: 406 events, +6.8%.

Kaspar Rufibach Futility analyses #18 / 39

Futility interim: reduce expected sample size under H_0 .

Efficacy interim: reduce expected sample size under H_1 .

Kaspar Rufibach Futility analyses #19 / 39

So, among statisticians we agree:

Futility analyses are a useful tool.

Kaspar Rufibach Futility analyses #20 / 39

Meet the team:

Kaspar Rufibach Futility analyses #21 / 39

"We risk to stop a trial which could be positive at the final analysis."

Kaspar Rufibach Futility analyses #22 / 39

1000 simulated trials assuming HR = 0.75, with interim

Kaspar Rufibach Futility analyses #23 / 39

If you power a trial at 80% you already have "false-negative" risk of 20%.

Futility adds 2.4% on top of that.

But reduces expected sample size by 35% if drug does not work.

And you can compensate for power loss in trial design, if you wish.

Kaspar Rufibach Futility analyses #24 / 39

Roche: retrospective analysis.

A futility analysis would have virtually never stopped a molecule that works.

Kaspar Rufibach Futility analyses #25 / 39

114 events with HR > 1.

266 events with HR such that final analysis HR ≤ 0.818 .

Two heterogeneous parts. Regulatory risk!

Kaspar Rufibach Futility analyses #26 / 39

Sponsor bought in to design multimillion trial based on HR = 0.75.

But is not confident to pass futility analysis with boundary HR > 1 after 114 events?

Kaspar Rufibach Futility analyses #27 / 39

"Trial costs are not linear in trial duration. We do not save much money if we stop at a futility."

Often true.

But a futility is not only about your trial!

Protect patients.

Portfolio view.

Inform other projects. Efficiency of drug development.

Kaspar Rufibach Futility analyses #28 / 39

"My molecule may just barely make it at the final. A futility is too risky."

That is exactly when you need one most!

Kaspar Rufibach Futility analyses #29 / 39

"A futility puts the integrity of the trial at risk."

iDMC. Same process as for efficacy interim.

Kaspar Rufibach Futility analyses #30 / 39

"Regulators do not like futilities."

Just plain wrong. Futility considered sponsor's risk.

What regulators do not like: badly designed trials. With or without futility.

Kaspar Rufibach Futility analyses #31 / 39

"We have a delayed effect."

Fair point.

Need to very carefully design a potential futility.

Kaspar Rufibach Futility analyses #32 / 39

"Our primary endpoint is not mature at a typical futility timepoint."

Fair point.

Can use "totality of evidence", surrogate endpoints, safety, PK, etc.

Much more (regulatory) freedom to design futility compared to efficacy.

You will not make an efficacy claim!

Kaspar Rufibach Futility analyses #33 / 39

Futilities derisk Phase 3 trials.

Potential for acceleration.

Kaspar Rufibach Futility analyses #34 / 39

Reduce expected sample size if drug does not work.

Risk to stop working molecule typically small.

Not only about "your" trial, but about patients, risk mitigation, other projects!

No threat to integrity or regulatory acceptance.

If done properly!
